DISCIPLINE CONSISTENCY

BY Jack PRINTEZY

WHY USE IT

Technical analysis ain't some fancy jumbo-mambo, it's the bread and butter, see?

You gotta chart the patterns, spot the trends, know where the support and resistance is at. It's like readin' the enemy's playbook before they even hit the field.

TYPES OF TA

There are a few Technical Analyses that have been used by traders for decades to spot the right entry and exit point.

1. Support & Resistance
2. Trendlines
3. Chart Patterns
4. Candlestick Patterns

SNR

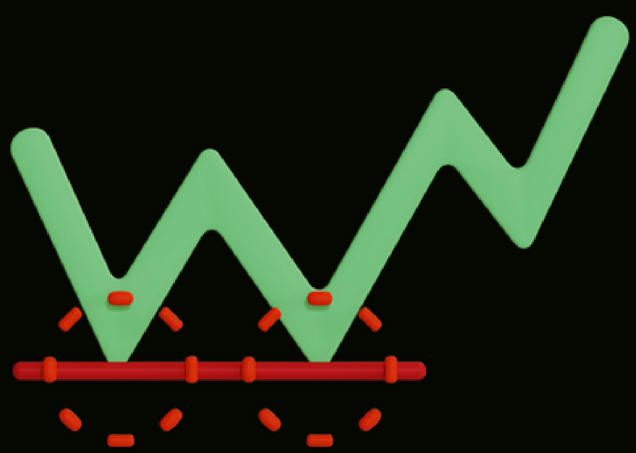
Support and resistance are key concepts in technical analysis that help traders identify potential price points where a stock's price might reverse.

How traders use support and resistance:

- Identifying entry and exit points: Traders might buy near support levels, anticipating a bounce, and sell near resistance levels, anticipating a pullback.
- Setting stop-loss orders: To limit potential losses, traders often place stop-loss orders just below support levels (for long positions) or just above resistance levels (for short positions).
- Determining trend direction: Observing how the price interacts with support and resistance can help traders understand the prevailing trend.

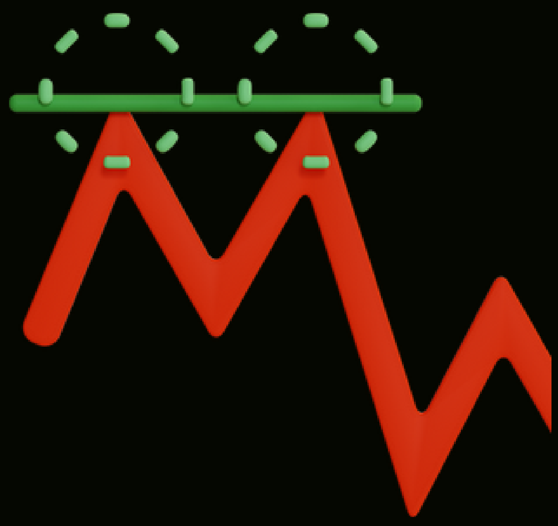
SUPPORT

At support levels, demand (buyers) is stronger than supply (sellers). This increased buying interest prevents the price from falling further. Think of it like a bargain sale – when prices drop to a certain point, more people are tempted to buy.



RESISTANCE

At resistance levels, supply (sellers) is stronger than demand (buyers). As the price rises, more sellers enter the market to take profits, increasing the supply and halting the price increase. It's like a store raising prices when an item becomes popular – they know people are willing to pay more.



SNR KEY POINTS

- These levels aren't always exact lines. They can be more like zones or areas on a chart.
- Support can become resistance, and vice versa. If the price breaks below a support level, that level can then act as resistance on any subsequent attempts to move back up. The same is true for resistance becoming support.
- The more times a level is tested in the past prices, the stronger it becomes. If a price repeatedly bounces off a support level, it indicates a strong buying interest at that price, making it a significant level to watch. Note that, if the level is tested many times in a short time (in a day) the level might be easier to be broken by the price.
- Breakouts are important. When the price decisively breaks through a support or resistance level, it can signal the start of a new trend.

TRENDLINE

A trendline is a straight line drawn on a price chart that connects a series of highs (for a downtrend) or lows (for an uptrend). It acts as a dynamic support or resistance level.

- Uptrend: A trendline drawn below a series of successively higher lows. It slopes upwards, indicating that the price is generally moving higher.
- Downtrend: A trendline drawn above a series of successively lower highs. It slopes downwards, indicating that the price is generally moving lower

HOW TO DRAW

- At least two points are needed: To draw a trendline, you need at least two significant highs or lows.
  However, the more points the trendline connects, the more reliable it becomes.

- Connect the points: Draw a straight line connecting these points. Ideally, the line should touch or come close to multiple price points.

- Consider the angle: The angle of the trendline indicates the strength of the trend. A steeper angle suggests a stronger trend, while a shallower angle suggests a weaker trend.

PRINT EZY

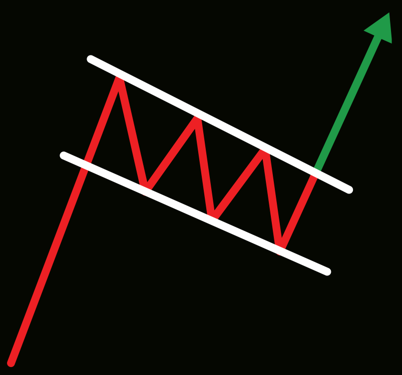
TL KEY POINTS

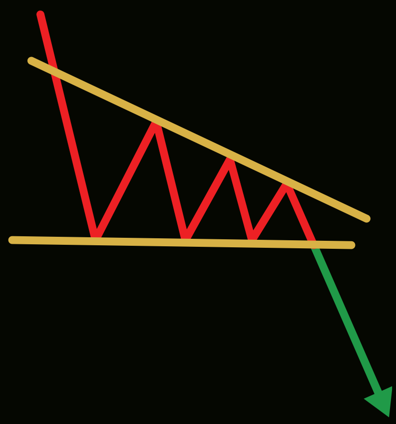
- Trendlines are not always perfect: Prices may not always perfectly adhere to the trendline. Minor breaches are common.
- Trendlines can be broken: When the price decisively breaks through a trendline, it can signal a trend reversal.
- The longer the trendline, the more significant the break: A break of a long-term trendline is generally considered a stronger signal than a break of a short-term trendline.
- Trendline can acts as support and resistance: As mentioned earlier, uptrend lines act as dynamic support, while downtrend lines act as dynamic resistance.

CHART PATTERNS

Chart patterns are recognizable shapes formed by price movements on a chart. They are classified into two main categories:

- Reversal patterns: These patterns signal a potential change in the prevailing trend. They indicate that the current trend is likely to reverse direction.
- Continuation patterns: These patterns suggest a temporary pause in the current trend before it resumes in the same direction.





REVERSAL

- Head and Shoulders: A pattern with three peaks, the middle one (the "head") being the highest, and two lower peaks on either side (the "shoulders"). It signals a potential reversal from an uptrend to a downtrend.
- Inverse Head and Shoulders: The opposite of the head and shoulders, with three troughs, the middle one being the lowest. It signals a potential reversal from a downtrend to an uptrend.
- Double Top/Bottom: Two peaks (tops) or troughs (bottoms) at roughly the same price level. A double top signals a potential reversal from an uptrend, while a double bottom signals a potential reversal from a downtrend.
- Wedges (Rising/Falling): Converging trendlines that slope in the same direction. A rising wedge is bearish and signals a potential reversal from an uptrend, while a falling wedge is bullish and signals a potential reversal from a downtrend.

CONTINUATION

- Flags and Pennants: Short-term patterns that resemble flags or pennants. They represent brief consolidations within a trend before it resumes
- Triangles (Ascending / Descending / Symmetrical): descending triangle is generally bearish, and a symmetrical triangle can be either bullish or bearish depending on the breakout direction.

CHART PATTERNS KEY POINTS

- Patterns are not always perfect: Real-world patterns may not always perfectly match the textbook examples.
- Volume is important: Volume often confirms the validity of a chart pattern. For example, a breakout from a pattern should ideally be accompanied by increased volume.
- Context is crucial: The significance of a chart pattern depends on the overall market context and the time frame being analyzed.
- False breakouts can occur: Sometimes, the price may appear to break out of a pattern but then reverse direction.

CANDLESTICK PATTERNS

Candlesticks are graphical representations of price movements for a specific period (e.g., a day, an hour, a week). Each candlestick provides four key pieces of information:

- Open: The price at which the period began.
- High: The highest price reached during the period.
- Low: The lowest price reached during the period.
- Close: The price at which the period ended.

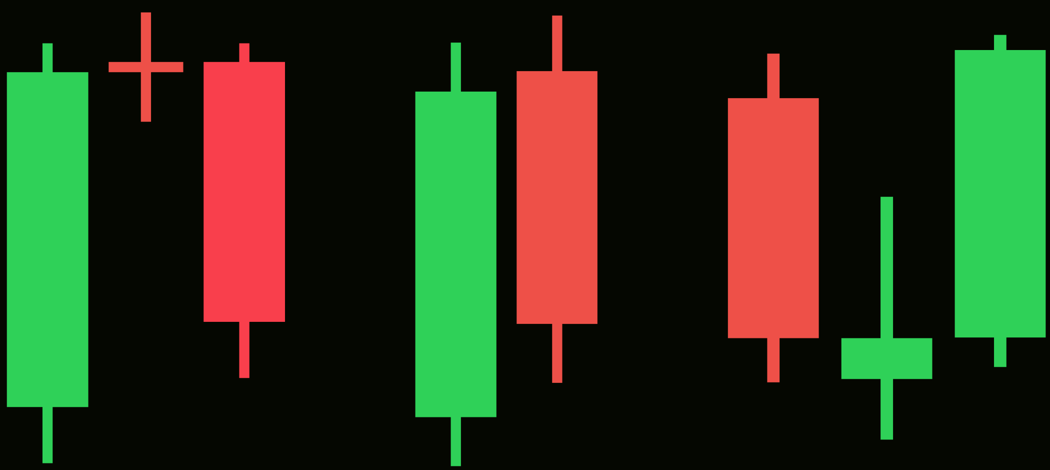
The "body" of the candlestick is the rectangle formed between the open and close prices. The thin lines extending above and below the body are called "wicks" or "shadows," representing the high and low prices.

- Bullish Candlestick (typically green or white): The close price is higher than the open price.
- Bearish Candlestick (typically red or black): The close price is lower than the open price.

CANDLESTICK PATTERNS CONT.

Candlestick patterns are categorized into two main types:

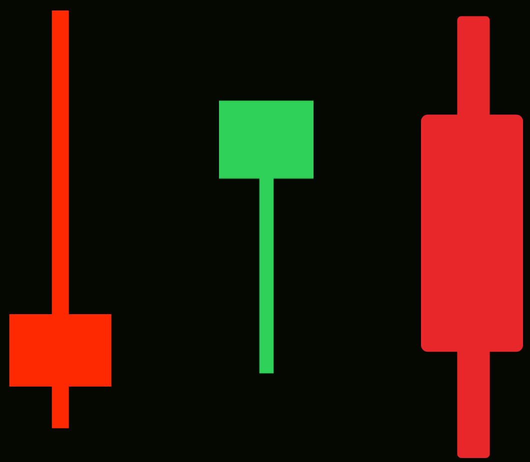
- Single Candlestick Patterns: These patterns are formed by a single candlestick and provide insights into the immediate price action.
- Multiple Candlestick Patterns: These patterns are formed by two or more candlesticks and provide more comprehensive signals about potential trend reversals or continuations.



SINGLE

Examples of Single Candlestick Patterns:

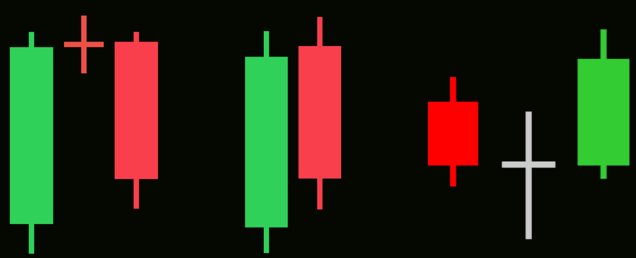
- Doji: A candlestick with a small body and long upper and lower wicks. It indicates indecision in the market.
- Hammer/Hanging Man: These patterns have small bodies and long lower wicks. A hammer appears at the bottom of a downtrend and suggests a potential reversal to an uptrend. A hanging man appears at the top of an uptrend and suggests a potential reversal to a downtrend.
- Marubozu: A candlestick with a long body and no wicks. A bullish marubozu indicates strong buying pressure, while a bearish marubozu indicates strong selling pressure.



MULTIPLE

Examples of Multiple Candlestick Patterns:

- Engulfing Patterns (Bullish/Bearish): A two-candlestick pattern where the second candlestick's body completely "engulfs" the body of the first candlestick. A bullish engulfing pattern signals a potential reversal to an uptrend, while a bearish engulfing pattern signals a potential reversal to a downtrend.
- Morning Star/Evening Star: These three-candlestick patterns signal potential trend reversals. A morning star appears at the bottom of a downtrend, while an evening star appears at the top of an uptrend.
- Three White Soldiers/Three Black Crows: These three-candlestick patterns signal strong trend continuations. Three white soldiers appear in an uptrend, while three black crows appear in a downtrend.



CANDLESTICK PATTERNS KEY POINTS

- Context is important: The significance of a candlestick pattern depends on the overall market context and the preceding trend.
- Confirmation is key: It's often advisable to look for confirmation from other technical indicators or price action before acting on a candlestick pattern.
- Not all patterns are reliable: Like any technical analysis tool, candlestick patterns are not always accurate.
- Combine with other tools: Using candlestick patterns in conjunction with other tools like support and resistance, trendlines, and chart patterns can improve the accuracy of trading decisions.
